

### What is QbCheck?

QbCheck is an online ADHD test that objectively measures the three core symptoms of Attention Deficit Hyperactivity Disorder (ADHD); activity, inattention and impulsivity. Together with other information, such as rating scales and a clinical interview, QbCheck will help your healthcare provider to assess you for ADHD.

After test completion, a test result is compared with individuals of the same age and gender, who have ADHD and those who do not. QbCheck cannot identify ADHD by itself, but the comparison to the age and gender matched groups will inform your healthcare provider about the likelihood of ADHD.

### How is a QbCheck performed?

The test is performed on a computer with a built-in web camera. During the test, a number of symbols are shown on the computer screen. The task is to push the space bar when a certain symbol appears on the screen. Meanwhile, a web camera uses facial recognition technology to track your movements during the test.

The test takes 15 - 20 minutes to complete (depending on your age) and is not dependent on your language, reading or mathematical skills.

Once you have completed your test, the result will be interpreted by your healthcare provider, who will discuss them together with other information during your next appointment.

### Frequently Asked Questions

#### Is QbCheck validated?

QbCheck is well documented, widely used, and registered or cleared by all concerned authorities, including The European Medicines Agency (EMA) and The Food and Drug Administration (FDA).

#### Will I know if I have ADHD after the test?

QbCheck should not be used in isolation and does not provide a diagnosis. Instead, the results need to be interpreted carefully as part of a comprehensive assessment to diagnose ADHD.

#### Will I be recorded during the test?

The web camera does not record images but only tracks movements. In addition, test results are anonymised and processed according to local data protection regulations.
